Contractor Estimator - User Manual

Overview:
This starter app provides a backend (Node/SQLite) and frontend (React) for creating estimates.

Running locally:
1) Backend: cd backend && npm install && node server.js
2) Frontend: cd frontend && npm install && npm run dev

Creating estimates: Use the frontend to add lines, choose seeded items (e.g. 12" Pier template)

Editing prices and items: Use the backend endpoints or connect a DB browser to backend/db/estimator.db

Google Drive Backup: Configure OAuth credentials and run backend/backup_to_gdrive.py

Troubleshooting:
- If server fails to start, check node version (>=18) and console errors.
- If DB migrations fail, delete db/estimator.db and restart server to re-run migrations.

Contact: For customizations, reply to your assistant session request.
